

The background of the slide is a composite image showing space debris in orbit above Earth. The Earth's blue and white horizon is visible on the left side. The space is filled with numerous pieces of debris, including satellite components, solar panels, and other man-made objects, against the blackness of space.

# Exploiting large astronomical data archives for space debris research

Stephan Hellmich

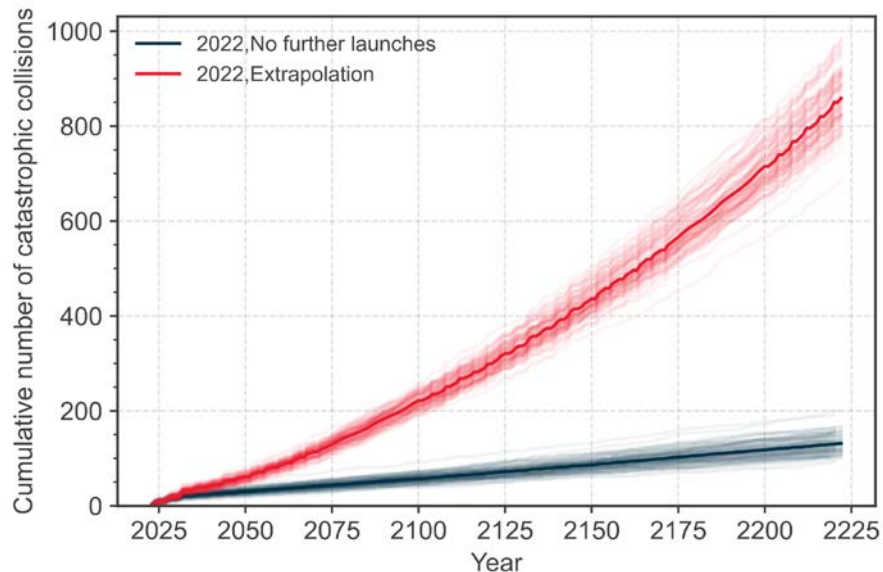

September 12 2022

# Space debris - A growing concern

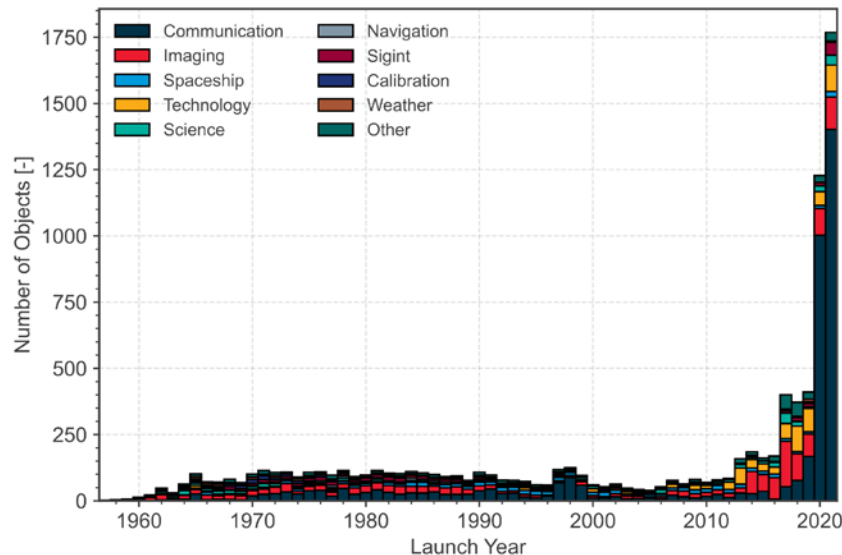

Monthly number of objects in Earth orbit officially cataloged by the U.S. Space Surveillance Network.  
NASA: ODPO

# Space debris - A growing concern

Number of cumulative collisions in LEO (simulated)  
ESA: Annual Space Environment Report 2022

Evolution of the launch traffic near LEO per mission type.  
ESA: Annual Space Environment Report 2022

- 3000 satellites in orbit
- >9000 to be launched until 2027

- 428 satellites in orbit
- 220 to be launched

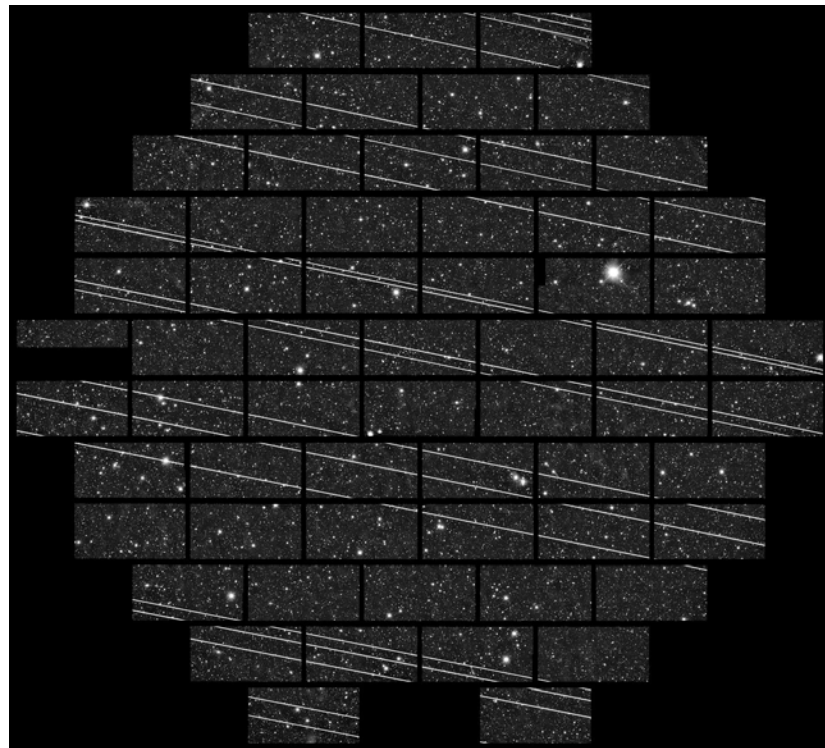

- 3276 satellites

## Impact of satellite constellations on astronomical observations with ESO telescopes in the visible and infrared domains

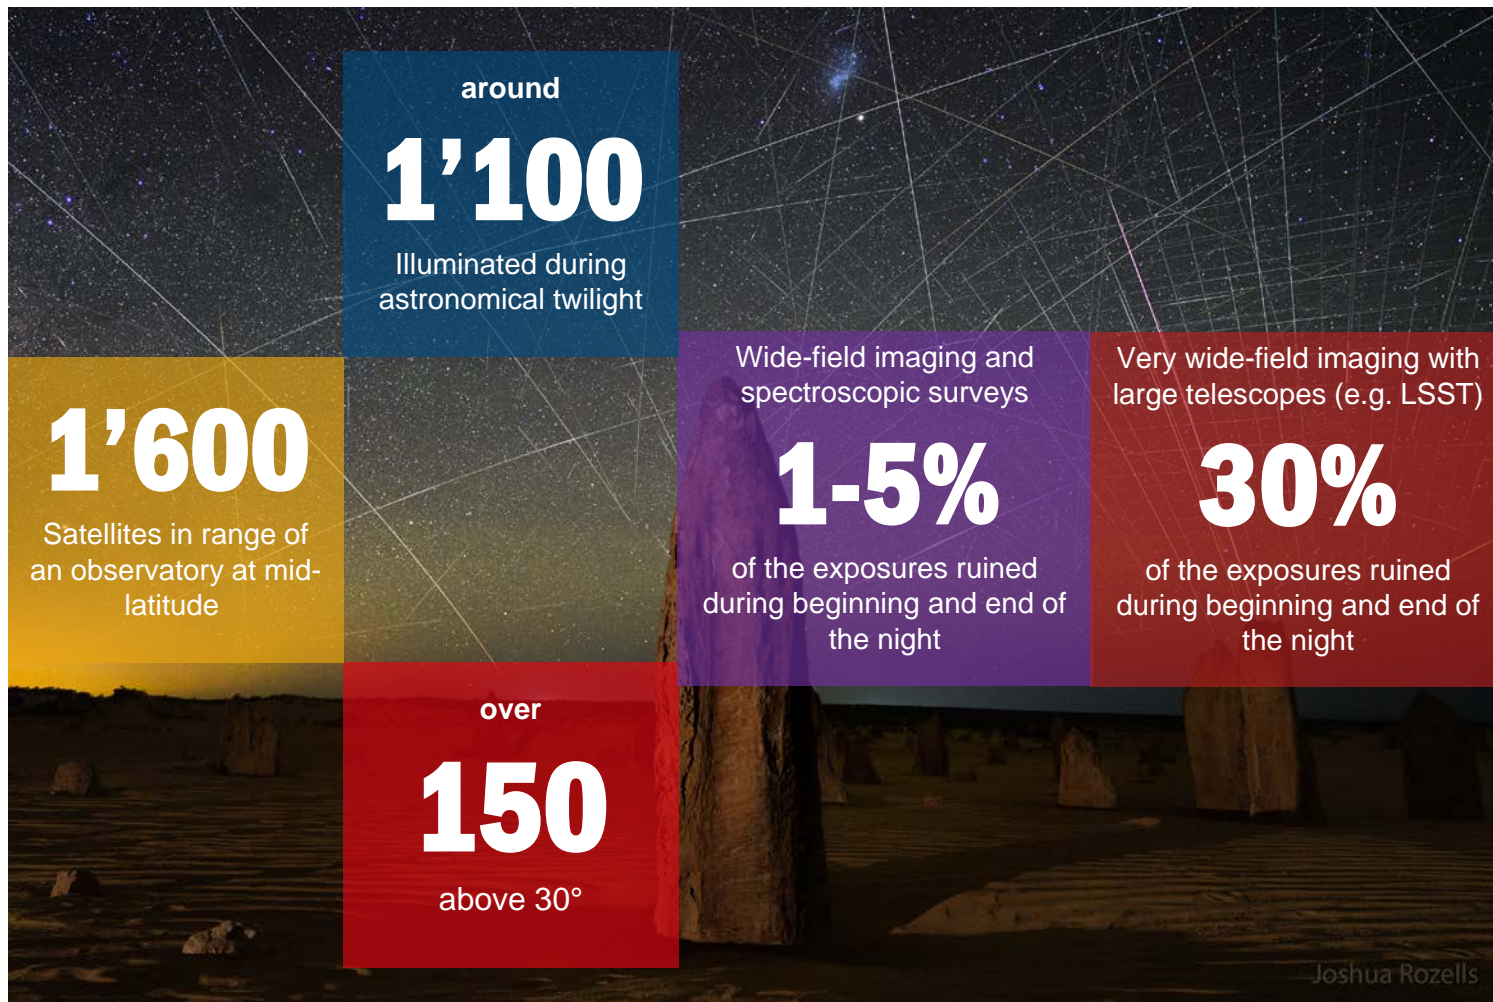

Olivier R. Hainaut, Andrew P. Williams, 2020, ESO

**26000 satellites**

from 18 representative constellations

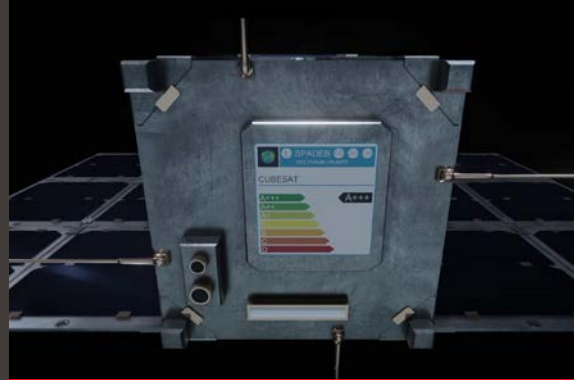

Starlink Satellites Imaged from CTIO  
CTIO/NOIRLab/NSF/AURA/DECam DELVE Survey

# What can we do ?

**Stop Launching**

**Active Space Debris Removal**

**Increase Sustainability in Space**

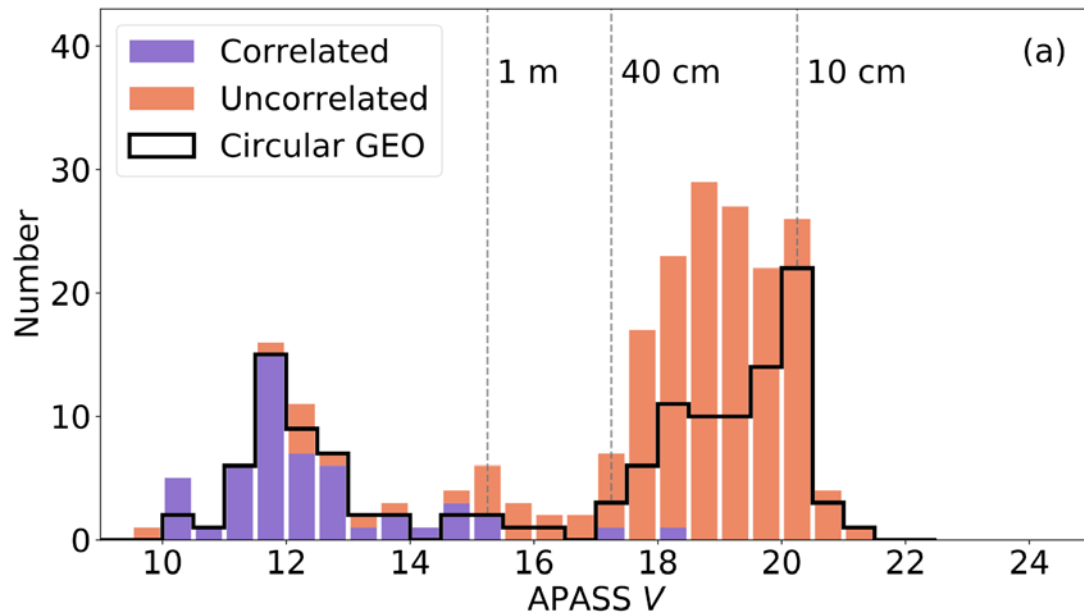

## DebrisWatch I: A survey of faint geosynchronous debris

James A. Blake et al., 2020, University of Warwick

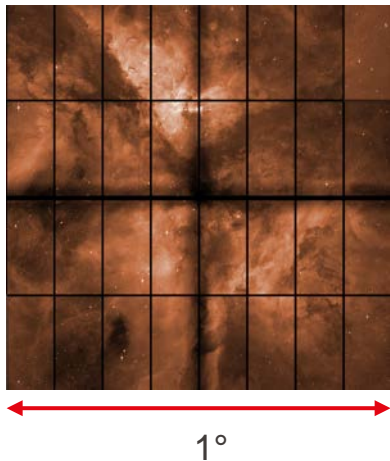

### 226 detections in 8 Nights

“over 80% of tracks with  $V < 15$  correlated with objects in the publicly available USSTRATCOM catalogue, while the vast majority of fainter tracks failed to correlate”

Brightness histogram for the detected population  
James A. Blake et al., 2020

# Where can we find it ?

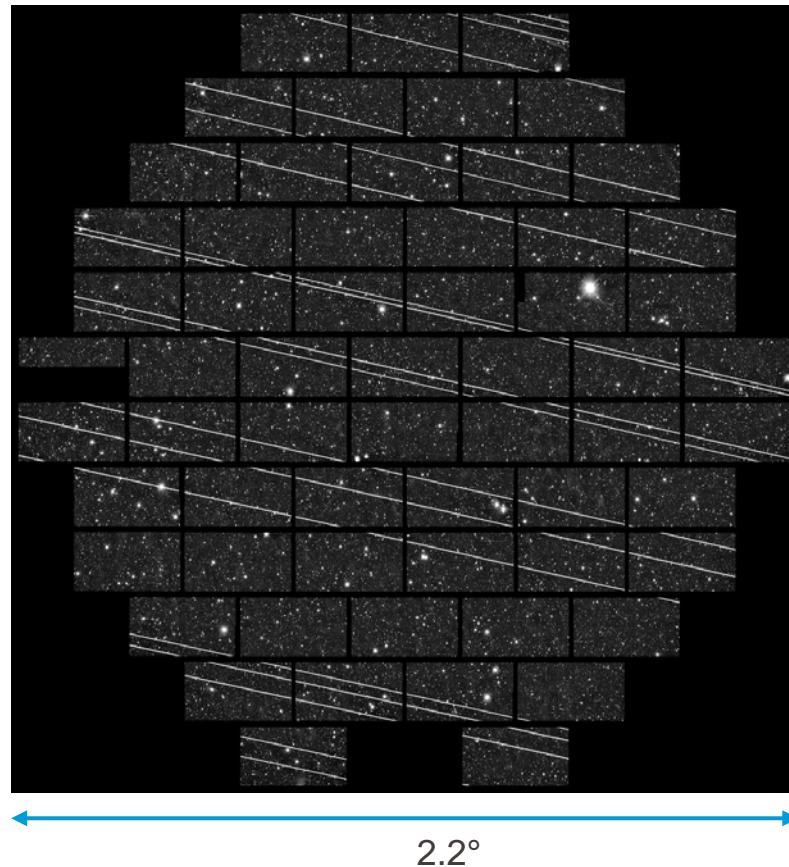

## ▪ OmegaCAM @ VLT Survey Telescope

- 2.6 m Telescope on Cerro Paranal
- 32 4k x 2k CCDs
- 1°<sup>2</sup> field of view

## ▪ DECam @ Blanco Telescope

- 4 m Telescope on Cerro Tololo
- 62 4k x 2k CCDs
- 3°<sup>2</sup> field of view

## Streak detection

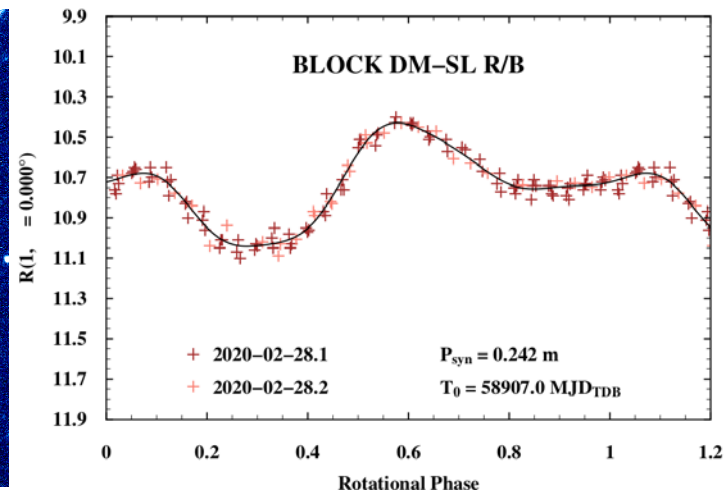

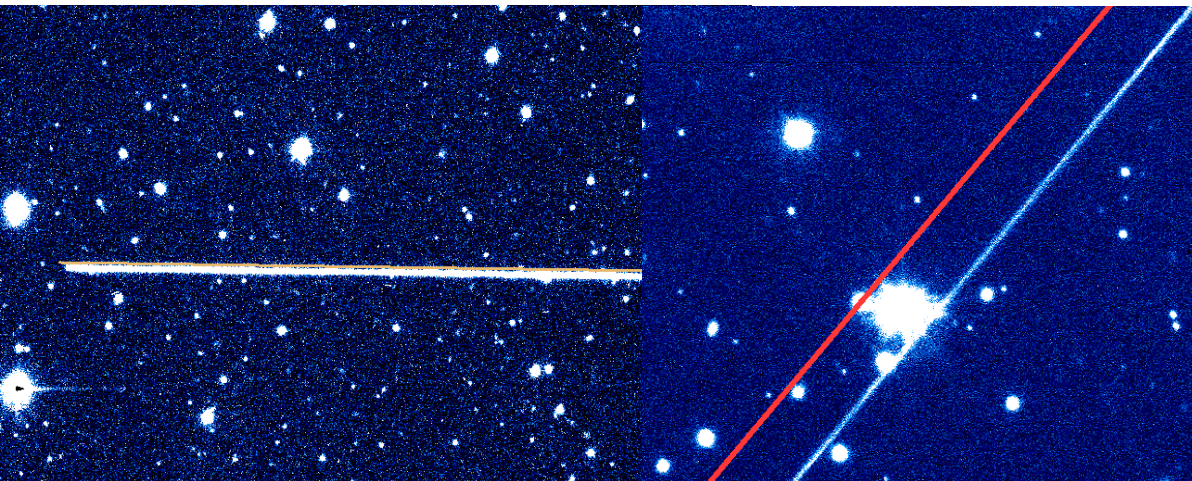

- Developing methods to efficiently extract satellite observations
- Evaluating traditional image processing algorithms and machine learning based methods

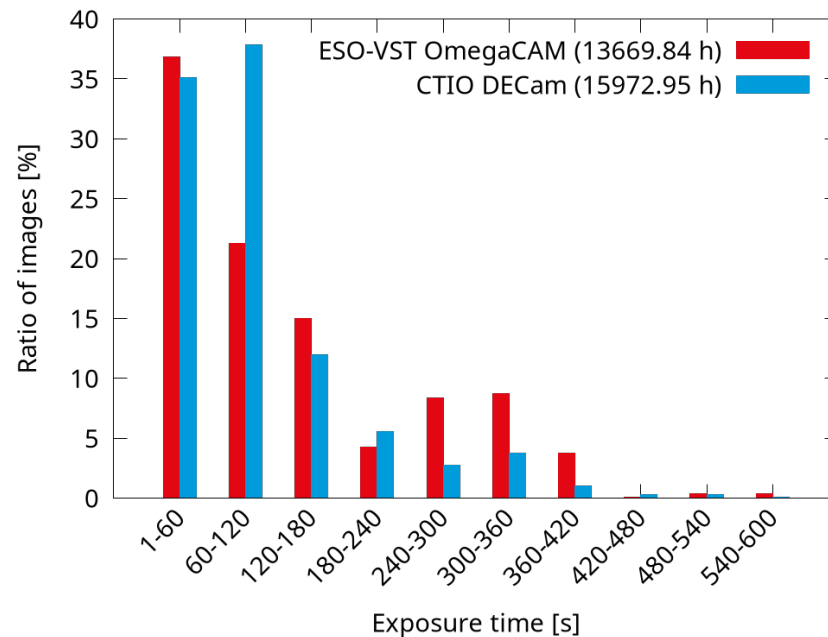

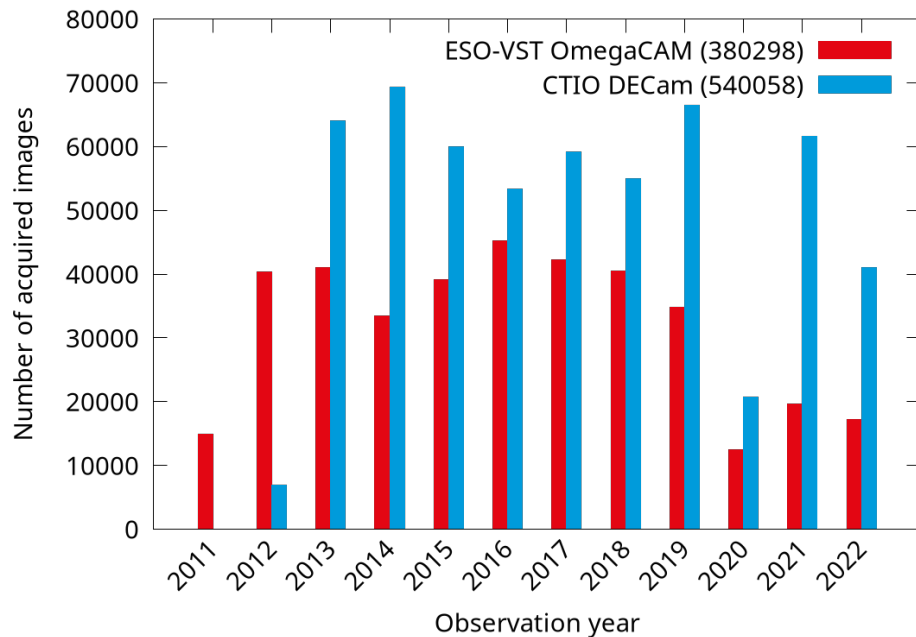

## Identification, orbit determination

- Interface to publicly available catalogs (AstriaGraph)
- Orbit determination for uncorrelated objects

## Photometry

- Lightcurve extraction from streaks
- Determination of rotation periods
- Phase curves to estimate object sizes

# What can we expect to find in the DECam archive?
